

Key Features: SAVi Vensim File

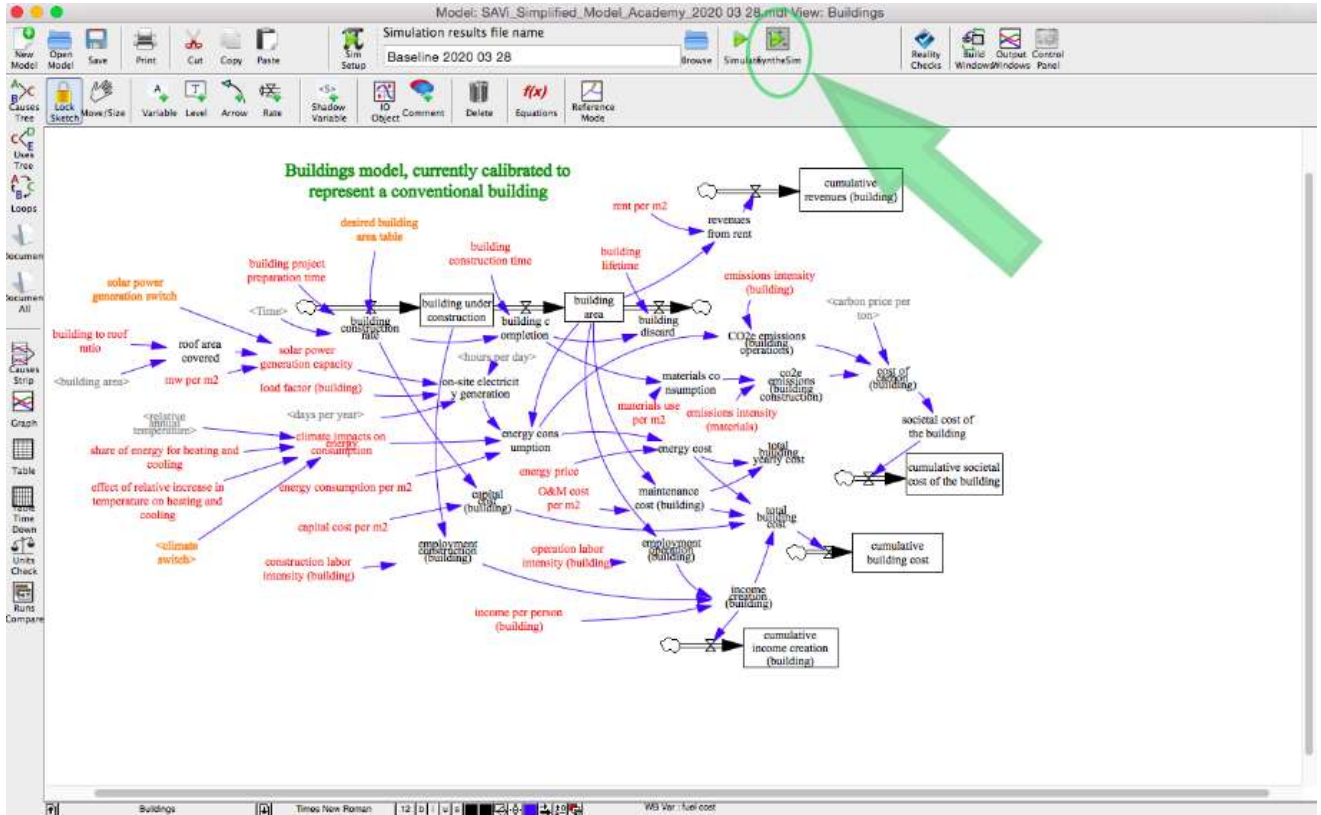

When downloading the SAVi Vensim file and opening the file with Vensim, you will find all standard SAVi models per asset type:

- Power generation
- Buildings
- Roads
- Irrigation
- Wastewater
- Natural Infrastructure

The following image illustrates where you can find, in the bottom left corner of the page, each asset type. When selecting an asset type, a diagram will appear that illustrates key indicators in relation to that asset type. These are merely for training purposes. For every SAVi application, these indicators and the relationship between them will be customized.

The next two images illustrate how you can change the values of certain key indicators by means of a cursor that will appear when you click (see green arrow on the image) on “SyntheSim”.

The below image will then appear. It displays various cursors (see within the green circles) on all the indicators that you may want to change values for. When you want to end this exercise and go back to the previous image, click “stop setup” (see green arrow).
